

How 3D printing works

1

Design it

Draw a 3D model in a design program, or download one that someone else has made.

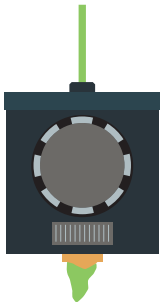

2

Slice it

A slicer cuts the model into thin layers and works out the path the printer will follow.

3

Print it

The printer melts the filament and builds the model up, one thin layer at a time.

4

Collect it

Let the plate cool, take your print off and leave the printer ready for the next person.
